

# DBMaker/DBMaster FAQ Document

## Question:

When running DBMaker perl sample program ("demo.pl") on DBMaker 5.0, what should be noticed by user?

## Answer:

Suppose that version of DBD::DBMaker is 0.15:

1. Notice version of DBMaker: the original Makefile.PL may contain the entry at line12:

```
my $DEFAULTVER = '3.7';
```

Modify the entry as follows:

```
my $DEFAULTVER = '5.0';
```

2. User may meet: the "fetchrow\_hashref" method in demo.pl program did not get correct result and it only shows "0" in each row

It's a bug of demo.pl sample, because DBMaker 4.x and 5.x has updated the policy for case sensitive (IDCAP=1 default), so demo.pl should be modified as following:

```
$hash_ref->{"Id"},$hash_ref->{"Name"},$hash_ref->{"Title"},$hash_ref->{"Phone"});
```

==>

```
$hash_ref->{"ID"},$hash_ref->{"NAME"},$hash_ref->{"TITLE"},$hash_ref->{"PHONE"}
```
