DBMaker/DBMaster FAQ Document

Question:

How to investigate the causes of ERROR (6590) while creating Stored Procedure? (DBMR2613)

Answer:

1.Check <procedure_name>.msg, and according to the massage which included in it to investigate reasons.

2. If <procedure_name>.msg is empty, check the sp32.bat.

First, check whether the version of Visual Studio matches with the version which you installed, if not, please change registry key with the correct value, for example:

```
 [HKEY_LOCAL_MACHINE\SOFTWARE\DBMaker\5.3]

"COMPILER"="VC80"
```

Second, if Visual Studio is installed on 64-bit operation systems, users need to choose "x64 Compiler and Tools" option, otherwise users cannot create stored procedures successfully.

In additional, DBMaker support Visual Studio 2012 from DBMaker5.3.1(#23266, 20140807).

Version: All

Product: Normal

Platform: Windows
