

DBMaker/DBMaster FAQ Document

Question:

How to avoid ERROR (6534) when create a database by JServerManager Tool with old bundle version on Windows? (DBMR2490)

Answer:

This error is caused by the conflict between libxml2.dll of JAVA7 and that of DBMaker. To avoid this error, users need to change the name of libxml2.dll in the same folder with javaw.exe to a new name or use DBMaker of new versions. In addition, this issue has been fixed after the versions of November 13, 2013.

Version: DBMaker 5.2.x/DBMaker 5.3.x

Product: Bundle

Platform: Windows
