

DBMaker/DBMaster FAQ Document

Question:

Why the error "invalid top directory at /usr/lib/perl5/5.8.8/File/Find.pm line 592" happens when "perl Makefile.PL" is executed? (DBMR2689)

Answer:

Because the source code of DBD is too old and DBD only supports DBMaker 5.1 and previous versions, so a user can install DBMaker 5.1 firstly and, then can execute "perl Makefile.PL" successfully, or manually modify the Makefile.PL file in DBD, for example, if the user currently uses DBMaker 5.4, he need to change "my \$DEFAULTVER = '5.1';" in Makefile.PL file to "my \$DEFAULTVER = '5.4';".

Version: DBMaker 5.3.x/DBMaker 5.4.x

Product: Normal/Bundle

Platform: Linux
