

DBMaker/DBMaster FAQ Document

Question:

How does the inside of the DBMaker deal with when insert BLOB data repeatedly?
Does it share the BLOB data when the inserted BLOB data is same?

Answer:

DBMaker will store only a single LO and share it between the tuples, If the same LO data is contained in many tuples. But that only occurred when UPDATA the data. When INSERT data, DBMaker can't assert whether the LO data should be shared. So it will store the LO data separately instead of sharing the data.
