

DBMaker/DBMaster FAQ Document

Question:

What should the program do when calling the ODBC functions and the returned SQL code is SQL_ERROR or SQL_SUSSESS_WITH_INFO? Does it need error handling?

Answer:

Yes, the program should do error handling. First, customer can use the **SQLERROR()** to get the details about the error message, Then use different methods to the different program in different compute language. To the Java program use **SQLException** or **SQLWarning** to deal with, and to the VC program is different.
