

DBMaker/DBMaster FAQ Document

Question:

Is there any bug about this kind of SQL, and what kind of result shall we get from the following SQL statement?

```
select * from (select * from t1 where a=1) a1 left join t2 b1 on (a1.a=b1.a)
```

Is the following SQL different meaning from the above SQL?

```
select * from t1 left join t2 on (t1.a=1 and t1.a=t2.a)
```

Answer:

The SQL statement 'select * from (select * from t1 where a=1) a1 left join t2 b1 on (a1.a=b1.a)' and 'select * from t1 left join t2 on (t1.a=1 and t1.a=t2.a)' means different. In fact, the second statement just like 'select * from t1 left join t2 on t1.a=t2.a where (t2.a=1)', the 'on' condition only used for join, not for the selection filter of t1.
