DBMaker/DBMaster FAQ Document

Question:

When does the DBMaker create .s1 file while unloading file from a DB?

Answer:

At present, The file size from DBMaker unloaded is about 1G,that's limitation of DBMaker in dmSQL tool; So when DBMaker detects the exported file size near 1G it will create a new external data file for rest data until exporting all the data. And the rest file will be named as **.s1, **.s2 and etc.
