

DBMaker/DBMaster FAQ Document

Question:

What the correct connection string should be? (From DBMR1734)

Answer:

For connection database, DBMaker supports two methods: Register DSN and do not Register DSN.

If you have registered DSN, The correct connection string that can connect to the DBMaker Database successfully should be as:

```
strConn = "DSN=data_source_name;UID=user_name;PWD=password"
```

If you did not register DSN, please follow the following connection string format when use ADO:

```
strConn = "Driver=DBMaker 4.1 Driver;  
DATABASE=Db sample4;  
SvAdr=192.168.0.164;  
PtNum=8888;  
UID=sysadm;  
Pwd=;  
ATCMT=1;"
```

And please pay attention to the following items:

1. The order of the keywords should not be changed.
2. To different database, it should modify the values of the following keywords:

```
DATABASE=;  
SvAdr=;
```

DBMaker/DBMaster FAQ Document

```
PtNum=;
```

3. For different versions of DBMaker and DBMaster, it should modify the value of the **Driver** keyword to keep consistent with the software.

For example:

If the connected database is DBMaker 4.1, set **Driver=DBMaker 4.1 Driver**;

If the connected database is DBMaker 4.2, set **Driver=DBMaker 4.2 Driver**;

If the connected database is DBMaker 4.1, set **Driver= DBMaker 4.1 Driver**;

If the connected database is DBMaker 4.2, set **Driver= DBMaker 4.2 Driver**;
