

DBMaker/DBMaster FAQ Document

Question:

Why the previous DBMaker version can not start the DB after the DB was started by higher DBMaker version? Then how to solve? (From DBMR1747)

Answer:

Once you started the DB with the higher version, some file version or sys tables were modified, and the higher database can not be downgrade to lower DB or earlier versions. So it will not be started with the previous version any longer.

But you can unload the DB first then reload it into the previous DBMaker version using dmSQL.
