

DBMaker/DBMaster FAQ Document

Question:

If wants to change the character set, should it need to reinstall DBMaker and recreate DB? And is there encoding method like NLS_LANG of Oracle, so that user can not have to recreate DB? (From DBMR 1805)

Answer:

If wants to change the character set, user only needs to recreate DB with new **DB_LCODE**.

NLS_LANG in Oracle is a parameter which effects client side character set. Setting **NLS_LANG** can change client side character set.

DBMaker database character set is decided by **DB_LCODE** keyword. Client side character set is the default character set of the client side OS. DBMaker has no setting for client side character set, only supports **DB_LCODE** for Server side.
