

# DBMaker/DBMaster FAQ Document

## Question:

How to check the status after starting DB with NT Service and how to do when the service is on but the connect fail sometimes? (From DBMR1832)

## Answer:

After starting DB with NT service, the DB is in the middle of starting with creating Journal, at present, only journal file is increasing and it is not easy to judge DB's status from DB side.

User can set a wait time before "connect DB" or write a program to connect DB, if connection fails, retry, until connect to DB successfully.
