

DBMaker/DBMaster FAQ Document

Question:

What kind of action use memory space other than DCCA? (From DBMR 1839)

Answer:

Each connection will be allocated one private memory not in DCCA but on DB Server side to save private data, such as sort data.

ITT is local memory when needing to memory allocation, Operation System allows how much, DBMaker get how much. If the sorting data over ITT, DBMaker will create external file.

Memory table is local memory also, if over the allocated size, DBMaker will return 'out of memory'.
