DBMaker/DBMaster FAQ Document

Question:

Some customers experienced the error 11206 when starting the database as service on Windows 2003. If the server machine is rebooted, the problem disappears, and the service runs correctly, but when someone stops the service and re-starts it, the error occurs and exists until the machine is rebooted again，why?(DBMR1957; version：DBMaker 4.3)

Answer:

First, please check whether antivirus software prevents DBMaker accessing db files, which can result in starting db failure with error 11206. The similar issue is DBMR1737
