DBMaker/DBMaster FAQ Document

Question:

What's the difference between error 11206, 11210 and 11213? (DBMR1957; version□DBMaker 4.3)

Answer:

User can distinguish them by their letter.

Error 11213: cannot find file or directory in related directory.

Error 11210: cannot have permission to access this file

Error 11206: cannot create/open a file.

When starting db, DBMaker will access db files, so it needs to find files in related db directory, and if it does not find one, error 11213 occurs; or else, if also not having permission to access this file, error 11210 occurs. Error11206 does not only include the two situations, also include other unknown causes which result in operation a file failure.

If meeting any one of them, customer should consider above all reasons which result in operation file/directory failure.
