DBMaker/DBMaster FAQ Document

Question:

Why does DBMaker not use NAS

Answer:

The reasons that DBMaker does not use NAS are:

1.Simply, we cannot warrant and support this way.
2.Network makes performance worse.
3.Network failure can cause data inconsistency.
4.It can not make sure journal buffer can flush successfully.
5.If user put data and blob on net Network Storage, when journal file is on local, DBMaker should run OK, but we can not make sure the DB can be restored when some problem occurred. So, for safety, we do not suggest to use it.
