

# DBMaker/DBMaster FAQ Document

## Question:

How to fix invalid view? (DBMR3289)

## Answer:

If you dropped the table, then recreated the table, the view which was based on the table became invalid view. When you select the invalid view, you will get ERROR(6539): This view exists but it is invalid. Before DBMaker 5.4.3, you have to enter below command to recompile the view.

```
dmSQL> alter view view_name compile;
```

From DBMaker 5.4.3, we add new features when you create or alter table:

1. When creating table, DBMaker will automatically do "ALTER VIEW COMPILE" for all invalid view.
2. When altering table, DBMaker will automatically do "ALTER VIEW COMPILE" with dependency.

Version: 5.4.3

Product: Normal/Bundle

Platform: Windows/Linux
