DBMaker/DBMaster FAQ Document

Question:

Where does the driver stores informations when creating DSN?

Answer:

We got the Question you added in FAQ system. In fact, you can ask any question by sending mail to support_rd@syscom.com.tw And the FAQ system is only for us to publish some Question & Answer.

About your question:

2020-10-08 23:33 GIOVANNI ROSINI	**2020** When I create a system DSN using ODBC driver, username is stored somewhere so that, when I try to change it, previous user is automatically prompted as soon as I choose database name, and it's impossible for me to use a different user, also if I delete the DSN and recreate it. I can change server ip and port, but not the username. Where does the driver stores informations?

DBMaker/DBMaster FAQ Document

Thanks

Answer:
Any DB setting will be stored in dmconfig.ini, and you can add DB Name, modify user name/password, IP, port and so on in dmconfig.ini.
You can choose DB name in combox when creating ODBC DSN, and don't need to modify user name/password, IP, port.
Certainly, you can modify DSN name there.
