

DBMaker/DBMaster FAQ Document

Question:

How to connect to Server from Client in PHP program with DBMaker? (DBMR2016)

Answer:

For PHP programs connect to DB, we usually just need to set ODBC data source, then connect through DSN name. For example: **\$Conn =odbc_connect ("DBSample5","SYSADM","xxxxx");**

If you need to let program Client and DB Server are separated, we can do following:

1. Install DBMaker Driver or Client in Client.
2. Set IP and PortNum for DB
3. Add DSN in ODBC data source.

Note: Because dmconfig.ini had been set, you only need to choose DB Name from DropDownList (Database name (N) :) options in ODBC setting.

Version: DBMaker 5.x

Product: Normal, Bundle

Platform: Windows
