

DBMaker/DBMaster FAQ Document

Question:

How to avoid error: 10851 - invalid value in configuration file when database creation on 5 series reference old 4 series configuration setting on DB_USRBB? (DBMR: 2106)?

Answer:

When customer upgrade database from 4 series to 5 series, the customer should create an empty 5 database firstly. If customer copy same database setting from 4 as 5 database setting, they possible face database creation error - 10851 (invalid value in configuration file) for DB_USRBB setting value. Because the DB_USRBB default value is re-defined on 5 series, there are two ways to avoid this error.

```
[4.x db]
```

```
Db_usrbb=/home/dbmaker/4.3/database/customer.bb 2
```

```
[5.x db]
```

```
Db_usrbb=/home/dbmaker/5.2/database/customer.bb 3
```

1) Modify 2 to 3 for *.BB size.

2) Removed the parameter directly from the dmconfig.ini file.

Version: DBMaker4.x, DBMaker5.x
